using pascals triangle to establish co-efficients

				1					
			1		1				
		1		2		1			
	1		3		3		1		
	1	4		6		4		1	
1	5		10		10		5		1

$$(a+b)^5 = a^5 + 5a^4b + 10a^3b^2 + 10a^2b^3 + 5ab^4 + b^5$$

b) with $a = \frac{1}{4}$ and $b = 2x$

$$\left(\frac{1}{4} + 2x\right)^5 = \left(\frac{1}{4}\right)^5 + 5\left(\frac{1}{4}\right)^4(2x) + 10\left(\frac{1}{4}\right)^3(2x)^2 + \underbrace{10\left(\frac{1}{4}\right)^2(2x)^3}_{\text{circled}} + \text{therest}$$

This is the only thing that is required.

Term containing x^3 is

$$\begin{aligned} & 10\left(\frac{1}{4}\right)^2(2x)^3 \\ &= 10\left(\frac{1}{16}\right)\left(8x^3\right) \\ &= \frac{10}{2}x^3 \\ &= 5x^3 \end{aligned}$$

So the co-efficient of x^3 is 5

$(a+b)^5 = a^5 + 5a^4b + 10a^3b^2 + 10a^2b^3 + 5ab^4 + b^5$
